*IT & Business users prefer **pi***

over other BI Tools due to:

- *Simplicity*
- *Ease of Use*
- *Quick Deployment*
- *Flexibility*
- *High User Adoption*

pi is a Web based Business Intelligence & Analytics Suite that helps organizations attain improved visibility and insights into their data in form of Interactive Dashboards and Reports. It has the capability to integrate data from multiple sources and helps business users create their own multi dimensional analytical reports and perform detailed analysis. Business users need not undergo any specific training for using the tool and find it an indispensable analytical companion. The interactive feature set and advanced analytical capabilities helps users monitor the performance of their business and take proactive decisions on “Click of a Mouse”. All Adhoc querying and analysis requirements of users are addressed in an interactive format without any support from IT or external agencies.

Organizations looking for a reliable & easy to use BI Suite that would help their managers take more informed and better business decisions will definitely find **pi** as the most relevant option for reporting & analysis requirements.

pi^π Create your personalized Dashboards
and Reports within Minutes

Know More: Stay more informed about your business

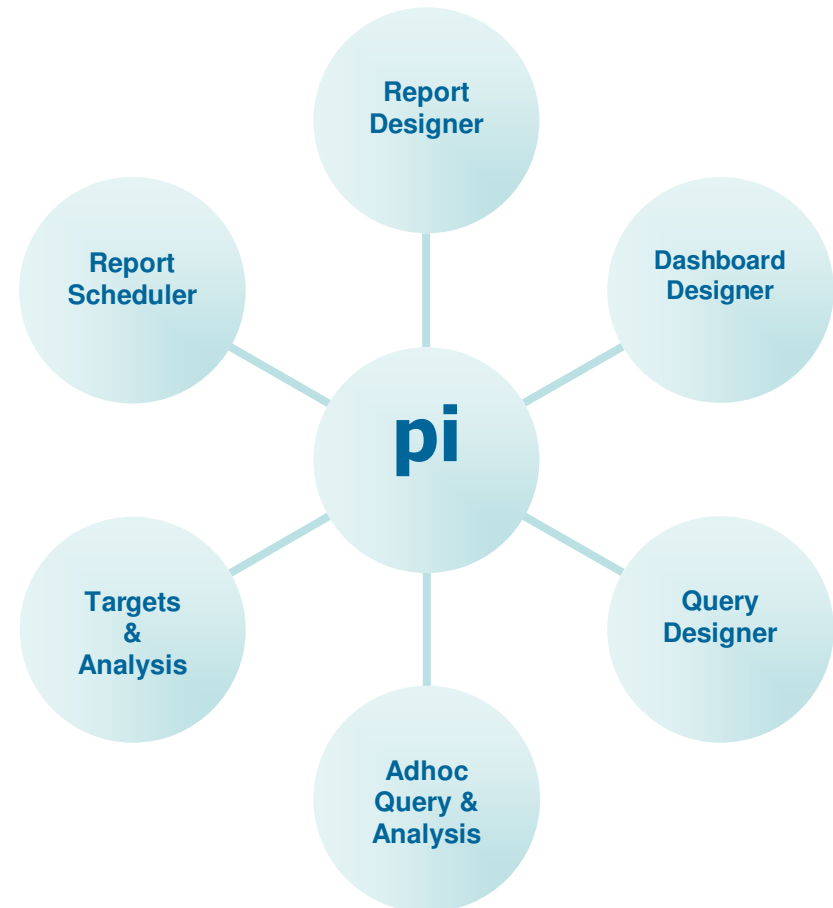

The core value of **pi** lies in converting raw data into insights. It ensures that the data captured and created with the business applications is transformed into information that drives competitive advantage. The benefits can be equally as valuable for executives making strategic decisions, as it can be for the middle management, business analysts or operations staff. Decision makers are provided with a unified view of their business using a "Single Source of Truth".

Do More: Drill to the level of detail you need

Our all BI Dashboards & Reports are supported by intuitive drill-down capabilities that enable users to drill to the level of detail for understanding the root cause of a problem and take appropriate action. Traditional business intelligence solutions commonly allow users to analyze trends in historical data but are rarely updated frequently enough or retain enough details to help managers identify potential issues. With **pi** all these issues are addressed automatically and users get a real time view of business.

Enable Proactive Decision making in your organizations

pi provides Alerts and Target Engine that helps users with Proactive decision-making. Notification messages or Alerts can be customized for intimating users depending on the criticality of the deviation from target values. By using this feature, users can take corrective actions before the situation goes out of control and gets escalated into real problem.

pi^π Anytime, Anywhere availability of
Information over the Web

Why choose pi over other BI Tools

Business users find pi 1.0 as the best choice for reporting & analysis as their decision making & analysis time by providing required information “On Click of a Mouse” without relying on external support. IT Managers find pi 1.0 an organizational friendly tool as it is not only light on their budgets but also has a lower running cost and high user adoption in the organization.
